Labour productivity as panacea for ageing?

Paper prepared for the 61st Annual North American Meetings of the Regional Science Association International, Washington DC, USA, 2014, November 12-15

Lourens Broersma
 Inge Noback
Jouke van Dijk (jouke.van.dijk@rug.nl)
Department of Economic Geography, Faculty of Spatial Sciences, University of Groningen, The Netherlands

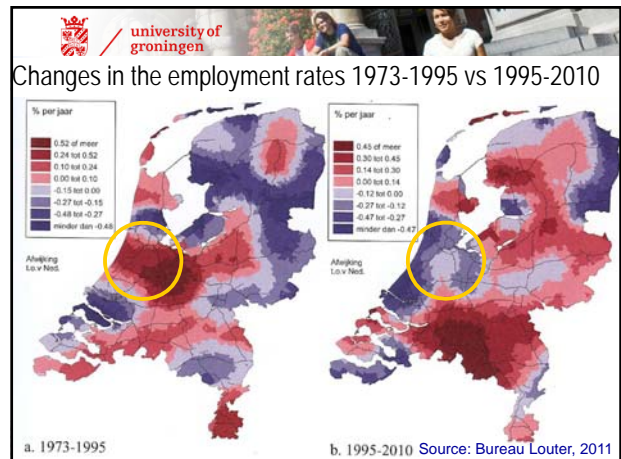

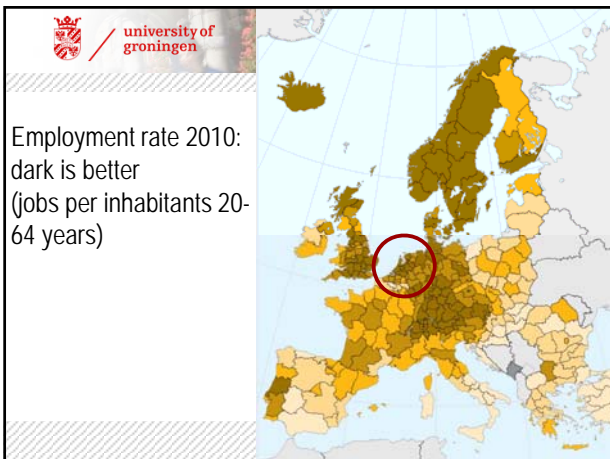

university of groningen

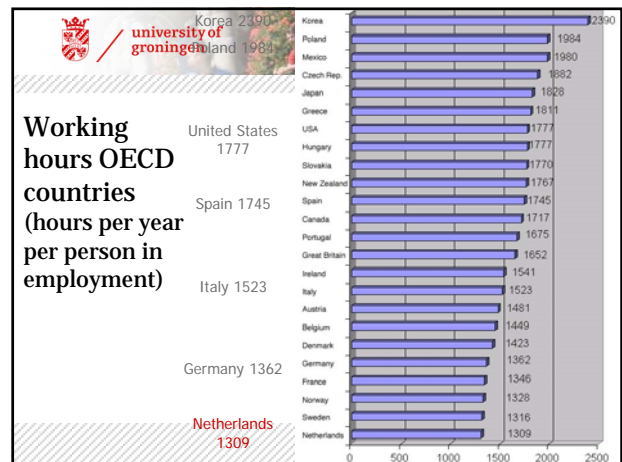

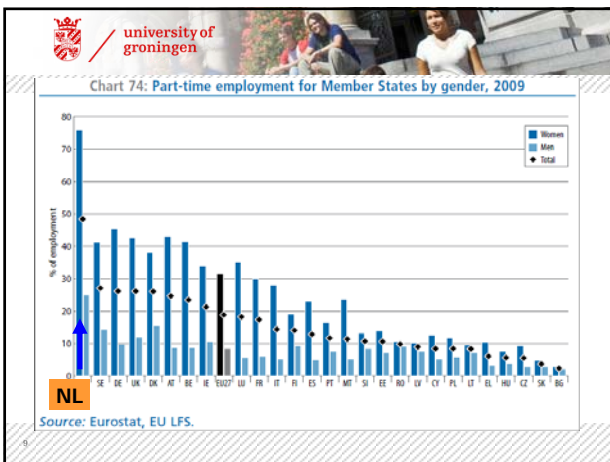

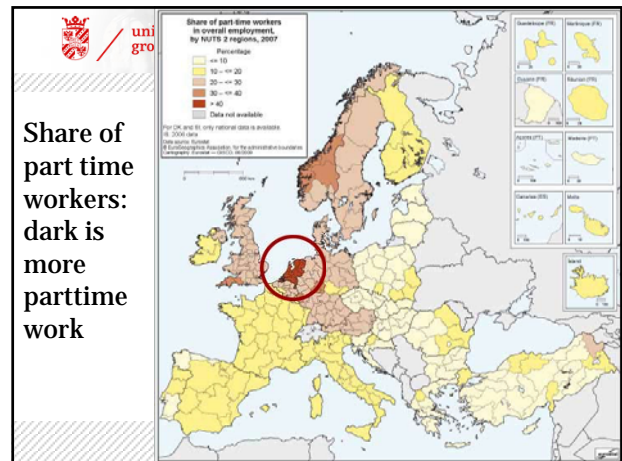

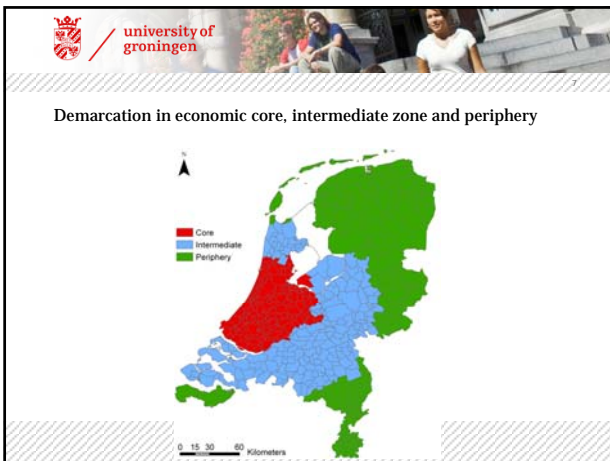

Motivation: keep up the welfare level

- > Wealth per cap = Labor productivity * hours per worker * net labor participation * population of working age

$$\frac{Y}{P} = \frac{Y}{H} \cdot \frac{H}{E} \cdot \frac{E}{P_{15-64}} \cdot \frac{P_{15-64}}{P}$$

- > Y = GDP, P = total population, H = hours worked, E = employed persons, P₁₅₋₆₄ = population of working age

Date: 13-11-2014 | 11

Possible solutions

- > Increase retirement age: popular policy measure, now gradually from 65 → 67
- > Increase participation: already high in the Netherlands
- > Increase work hours: Noback et al. (2013) Dutch are world champion part-time work
- > **OR:** → Increase in labour productivity
- > Interactions productivity with age, participation and working hours?
- > Regional specific approach?

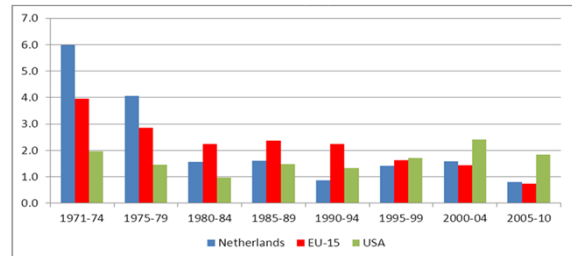

Labour productivity levels in The Netherlands, EU-15 and the USA

Table 1. Levels of labour productivity in Netherlands, EU-15 and USA, between 1970-2011 (index 1995=100)

	1970-74	1975-79	1980-84	1985-89	1990-94	1995-99	2000-04	2005-10
Netherlands	59,1	76,3	83,9	92,0	97,4	102,6	110,6	119,7
EU-15	56,4	65,6	73,8	83,4	93,3	102,9	111,1	118,1
USA	75,1	81,5	83,8	91,1	97,2	103,9	116,0	127,6

Source: EUKLEMS data base, Statistics Netherlands, Eurostat and US Bureau of Labor Statistics

Five-year average labour productivity growth in Netherlands, EU-15 and USA, between 1970-2011 (%)

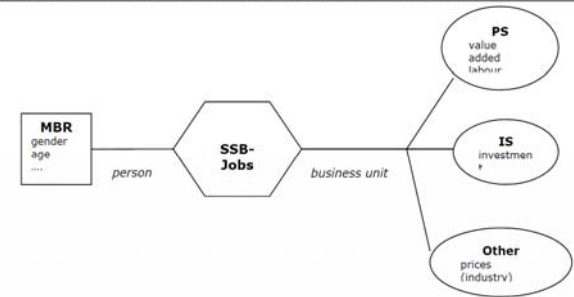

Source: EUKLEMS data base, Statistics Netherlands, Eurostat and US Bureau of Labor Statistics

Data

- > Matched employer-employee database
- > Register data Statistics Netherlands on all employee jobs (SSB-jobs) build from different sources (social premium registers, tax register, surveys, etc)
- > Period 1999-2005
- > Employer: survey information production statistics, wage costs, investment statistics, NACE code
- > Employee: in part survey data (work hours and wages)

Figure 3. Structure of Dutch matched employer employee data base

Note: The hexagon is the key data base linking persons to business units, the rectangular is a census, ovals are surveys.

Model specification

derived from **firm level** production function

- > **Level** of labour productivity

$$\log\left(\frac{Y}{n}\right) = \omega + \sum_m \alpha \eta_m \log x_m + \beta \log\left(\frac{k_{IT}}{n}\right) + \gamma \log\left(\frac{k_{non-IT}}{n}\right) + \xi \log n$$

- > Labour productivity **growth**

$$\Delta \log\left(\frac{Y}{n}\right) = \Delta \omega + \sum_m \alpha \eta_m \Delta \log x_m + \beta \Delta \log\left(\frac{k_{IT}}{n}\right) + \gamma \Delta \log\left(\frac{k_{non-IT}}{n}\right) + \xi \Delta \log n$$

Estimation results **level** of labour productivity (part 1)

Conclusions

- > A rise in the capital-labour ratio will raise productivity ratio for both IT and non-IT capital, but more for IT-capital
- > A rise in work hours slightly raises labour productivity (note: many people work part time!)
- > No differences in productivity by gender, certainly not after correcting for working hours

Conclusions

- › Better skilled → higher productivity
- › Larger firms → higher productivity
- › **Age: 25-44 year old show higher productivity levels, but lower growth rates than 15-24 and 55+**
- › Taking industry, firm size and differences in worker characteristics into account, productivity growth in the periphery exceeds that of the core

Discussion

- Maintain the welfare level in times of aging by:
- › Increase productivity + more working hours
 - › Invest in education and training
 - › More hours work of especially females
 - › Increase participation and keep older workers at work in combination with improving and maintaining skills → life long learning
 - › Agglomeration effects are limited: consider investing outside core region: Place Based Smart Specialization

Thank you for your attention!

Operational form for model of labor productivity level

$$\log\left(\frac{y}{h_t}\right) = \alpha_0 + \alpha_1 \log\left(\frac{k_{IT,t-1}}{h_{t-1}}\right) + \alpha_2 \log\left(\frac{k_{non-IT,t-1}}{h_{t-1}}\right) + \alpha_3 \log h_t + \alpha_4 \log|S_m - S_t| +$$

$$+ \alpha_5 \log S_{age1} + \alpha_6 \log S_{age2} + \alpha_7 \log S_{age3} + \alpha_8 \log S_{age4} + \alpha_9 \log S_{age5} + \quad (10)$$

$$+ \alpha_{11} \log S_{size} + \alpha_{12} \log\left(\frac{h_{t-1}}{e_{t-1}}\right) + \alpha_{13} \log\left(\frac{e_{t-1}}{p_{-1,15-64}}\right) + controls$$

Operational form for model of real labor productivity growth

$$\Delta \log\left(\frac{y}{h_t}\right) = \beta_0 + \beta_1 \Delta \log\left(\frac{k_{IT,t-1}}{h_{t-1}}\right) + \beta_2 \Delta \log\left(\frac{k_{non-IT,t-1}}{h_{t-1}}\right) + \beta_3 \Delta \log h_t +$$

$$+ \beta_4 \Delta \log|S_m - S_t| + \beta_5 \Delta \log S_{age1} + \beta_6 \Delta \log S_{age2} + \beta_7 \Delta \log S_{age3} +$$

$$+ \beta_8 \Delta \log S_{age4} + \beta_9 \Delta \log S_{age5} + \beta_{11} \Delta \log S_{size} + \quad (11)$$

$$+ \beta_{12} \Delta \log\left(\frac{h_{t-1}}{e_{t-1}}\right) + \beta_{13} \Delta \log\left(\frac{e_{t-1}}{p_{-1,15-64}}\right) + controls$$
